Dermatological extracorporeal shock wave therapy system

Device information

Definition

An assembly of devices designed to provide spark-gap-generated extracorporeal shock wave therapy (ESWT) intended to treat acute and chronic conditions of the skin and subcutaneous soft tissues (e.g., arterial, venous, diabetic or pressure ulcers; burns; postoperative or traumatic wounds; cellulite). It typically consists of a generator that supplies the high voltage energy; and a hand-held, fluid-filled, shock wave applicator that produces spark-gap (electrohydraulic) energy focused by an internal reflector and delivered non-invasively to the area of the skin in contact with the applicator. Treatment parameters are intended to be input manually by a healthcare professional.

Device type

General Medical Device

Does new medical device comply with device regulation: (EU) 2017/745 ?

N/A

Custom made?

No

Risk classification

Class I

Sterile?

No

Measuring?

No
